AUDIT INSIGHTS

The following insights synthesize the most important findings from this audit. They are ordered by expected impact and implementation urgency.

1. Content fundamentals are incomplete at scale

More than 2,200 pages lack meta descriptions and hundreds of title tags are either too long, too short, or duplicated. Important keywords aren't being used in meta tags.

2. Technical health is mixed — speed and indexing need attention

Page load speed is 3.42 sec. Google has 303 URLs indexed while the crawl found 2939 static indexable URLs. robots.txt is partially optimized.

3. On-page structure is inconsistent

11 pages missing H1, 133 duplicate H1s, 6024 images missing ALT text. Internal linking is sparse and rarely keyword optimized.

4. Authority base exists but is not competitive enough

526 linking root domains and 27.9K inbound links form a base, but the site still lags many ranking competitors in the space.

5. Local & entity signals are almost entirely missing

No Google Business Profile, no NAP on the website, and only minimal/unnamed schema. FAQ page exists but lacks FAQ schema.

6. Blog content not updated

There is no blog content added in the blog section since 2024. Add at least 1 weekly post and link it to the home and service pages.

Recommended Priority Sequence

1. Fix Title tags, Meta descriptions, and Heading structure.

2. Improve page load speed and close the indexing gap.
3. Implement schema, create Google Business Profile, add NAP.
4. Rebuild internal linking and resume weekly content publishing.
5. Increase quantity and quality of linking root domains.

6. CONCLUSION	37

1. SEO EXECUTIVE SUMMARY

<https://gufhtugu.com/> scored a 44% for overall SEO-ability (recalculated from all individual element scores using algorithm weights: On-site 26%, Indexing 12%, Linking/Social 62%). This is average & still leaves significant room for improvement. This prioritized list shows the key elements to optimize, from highest to lowest priority, for the three main areas of SEO; Content, Indexing and Linking/Social.

ON-SITE SEO	INDEXING	LINKING / SOCIAL
46%	60%	42%
26% of algorithm	12% of algorithm	62% of algorithm

TOP CONTENT ACTION ITEMS

Keyword Focus

<https://gufhtugu.com/> is a static site, it lacks a proper keywords focus, and important keywords aren't being used in meta tags.

Title Tags

489 Title tags are too long, 4 are same as H1, 40 are duplicates, 804 are too short, and 6 is missing.

Meta Description Tags

2 pages have duplicate Meta descriptions, 127 are too long, 0 are too short and 2282 pages are missing meta description tags.

Image Names and ALT Tags

6024 Images are missing ALT text, 315 have huge size and not all images have descriptive, keyword focused file names.

Heading Tags

11 pages are missing H1 tag, 133 pages have duplicate H1 tags and 29 H1 tags are too long. 154 pages have multiple H1 tags.

Internal Linking and Anchor Text

Only 1 internal link is present inside each blog post and they are also generic, not keyword optimized.

Top Indexing Action Items

Page Exclusions

No pages are excluded from indexation.

Page Load Speed

Page load speed is 3.42 sec, you can improve page load speed by reducing page file size and number of requests.

Code Validation

Code validation is good.

URL Redirects

86 standard non-WWW to WWW redirects are in place. 64 pages are with 301 redirect, and 22 pages are with 302 redirect.

Broken Links

Google webmaster Tools for the site identified 20 error pages with 404 response code.

Schema & Structured Data

There is one unnamed schema which is of no use. FAQ page lacks FAQ schema.

AI Optimization

The website doesn't contain answer ready content that are necessary to get cited on AI search engines.

Top Linking/Social Action Items

Linking Root Domains

Increase both the quantity and quality of linking root domains.

Inbound Followed Links

Work to build out more keyword rich anchor text links for non-branded keywords while also working to increase the overall quantity and quality of inbound links.

Competitive Link Comparison

Relative to stronger competitors in the online bookstore and publishing space, the current link profile lags.

Social Media Mentions and Visibility

You aren't much active on social fronts, reconsider your approach please.

Google Business Profile

The Google Business Profile is not made so it can't be audited.

NAP Consistency

<https://gufhtugu.com/> doesn't mention address and phone number and also doesn't have a GMB.

Simply start with #1 in each category and work your way down the list. By implementing the changes that I have recommended, the Website will be well on its way to achieving more excellent rankings for its chosen keyword phrases.

2. SEO SCORECARD

A score of 10 is perfect execution and a score of 1 means that element is missing entirely. Category percentages = average of individual element scores × 10. Overall = weighted sum (On-site 26% + Indexing 12% + Linking/Social 62%).

3. CONTENT OVERVIEW

SCORE
46%

This analysis addresses all of the SEO Indexing related issues found on the

This analysis addresses all the on-site SEO content related issues found on the Website. Implementing the recommended changes should provide valuable SEO benefits. There are 10 main on-site SEO topics covered.

Major Issues (1-3)

Moderate Issues (4-7)

Minor Issues If Any (8-10)

For each main on-site SEO topic, there are 3 sub sections: Analysis, Recommendations and Guidelines.

The Website has an On-Site SEO Score of 46%. This indicates average on-site SEO-ability. Correct implementation of the proceeding guidelines will help to improve existing rankings, and to rank for more competitive keyword phrases in the future.

Keyword Focus

Score 5/10

Analysis

<https://gufhtugu.com/> lacks a proper keywords focus, and important keywords aren't being used in meta tags.

Recommendations

You should consider building out more top-level pages and adding more content. Conduct proper keywords research and use one- or two-min keywords and keyword variations per page.

Guidelines

One of the most important on-site SEO elements is text content, and search engines want to see a significant amount of unique text on each page. Under ideal circumstances I would recommend having 400-600 words of unique text per page, though I believe the safe minimum is 300 words.

URL Structure

Score 7/10

Analysis

I found the URL structure to be good, 2 pages had URLs that had underscores (_) in them and 0 URLs longer than 115 characters was found. Some URLs had unusual characters. The URL structure overall great and perfect.

URL

https://gufhtugu.com/seerat_e_pak/https://gufhtugu.com/_trashed/

Recommendations

Ideally, no URL should be longer than 100 characters in length. If possible, create shorter URLs for any pages that exceed this limit (if you change a URL, 301 redirects will be necessary). The attached site crawl report will help you to identify the URLs in need of optimization. That said, keep in mind that this is far from a critical issued, and could safely be ignored.

Guidelines

A site's URL structure is extremely important to both users and search engines. Poor URL structure can hurt rankings, prevent pages from being indexed and lower your click-through-rate (CTR).

It is extremely important that URLs be readable, user friendly, and that they contain the keyword of the page. Always separate keywords with dashes, not underscores. If relevant, a geo-qualifier (such as Vancouver, BC) should also be included. URL file names should always be written in lowercase letters.

URLs should also be relatively short, with 100 characters in length being the current SEO best practice. While longer URLs aren't necessarily bad, the shorter the URL the less likely that URL is to truncate in search results and the more likely it is to have a positive impact on SERP click-through-rates.

If query parameters are necessary for analytics or paid advertising reasons, make sure to use Google and Bing webmaster Tools to tell search spiders to ignore those parameters from an indexing perspective. It won't impact your tracking but will prevent any indexing issues related to parameters from occurring. Make sure that parameter pages are not linked to internally.

Title Tags

Score 5/10

Analysis

URL	Title
https://gufhtugu.com/	Pakistan's Leading Online Bookstore 📖 - Order Now Gufhtugu
https://gufhtugu.com/apka-mujrim/	Apka Mujrim - آپ کا مجرم - Gufhtugu

<https://gufhtugu.com/gufhtugu-publications-ensuring-quality-and-authenticity-in-every-purchase/>

Gufhtugu Publications  | Ensuring Quality & Authenticity In Every Purchase

I found 489 pages where the Title tag exceeded Google's truncation limit, 804 that are too short, 40 duplicates, and 6 pages that are missing a Title tag.

While existing Title tags aren't fairly well written overall.

Recommendations

I recommend that optimized Title tags be re-written for each page that has an overly long, short or otherwise un-optimized Title tag. I particularly recommend writing a new home page Title tag.

Guidelines

After the URL, the second most important place on a page to have the keyword is the Title tag. The Title tag is the first description of the page that search engine users will read, and it is extremely important to both users and search engines that it contain the keyword they are searching for. This will not only help to improve rankings, but can significantly improve your click-through-rate as I'll.

A proper Title tag will:

- Be 15-60 characters in length (50-60 is ideal).
- Be unique to that page (don't use the same title tag on multiple pages).
- Use the keyword of that page twice if space permits (once at the start, followed by separator such as a colon, hyphen, or pipe, and then once again in a call to action). If the character limit prevents the use of the keyword twice, use it once in a good call to action, with the keyword as close to the beginning of the Title tag as possible.
- If relevant, include a geo-qualifier (such as Washington or Seattle, WA).

While you may hear some SEOs say to limit Titles to 70 characters, it's a misconception. Google is using a pixel width limit, not a character limit. Title tags appear in 12pt Arial font by default, with searched for keywords bolded, and Google has a pixel width limit of 520 pixels.

Using 60 characters as your Title character limit will avoid truncation in the vast majority of cases.

Meta Description Tags

Score 5/10

Analysis

2282 pages are missing a Meta description tag, 2 pages have duplicate Meta descriptions, 127 Meta descriptions are too long, and 0 pages have too short, 0 pages on the site have multiple Meta description tags.

Recommendations

I recommend that unique, keyword and user targeted Meta description tags be re-written for each page that has two tags, or that is currently missing a description (every page on the site). Every page on a site should have a unique, keyword optimized Meta description tag.

Guidelines

While Meta description tags are a factor in the ranking algorithm, they are also used as the description searchers will see in the search engine results. Having the keyword used properly in the Meta description tags can increase the likelihood that users will click on the link to the page if the keyword usage matches their search query.

Meta descriptions should adhere to the following guidelines:

- Be unique and relevant to that page.
- Be written as descriptive ad text, with a call to action.
- No more than 160 characters in length including spaces and punctuation (140-150 is ideal), but no less than 51 characters (Google considers 60 characters or less to be too short).
- Contain 1-2 complete sentences with correct punctuation, and no more than 5 commas.
- Use the keyword once per sentence, as close to the start of each sentence as possible.
- Include a geo-qualifier, such as "Seattle, WA", if relevant.

Heading Tags

Score 3/10

Analysis

11 pages are missing H1 tag, 133 pages have duplicate H1 tags and 29 H1 tags are too long. 154 pages have multiple H1 tags. 2939 pages on the site have H2 tags and 2589 of them are duplicate.

Recommendations

You should consider adding H1 tags to the pages that are missing them, and you should make sure that heading tags in general are unique & use keywords more effectively where relevant.

Guidelines

Search engines might look for SEO value based on text size and position on the page. Heading tags are supposed to be larger than the other text on the page, and should appear prominently on the page, thus the added benefit of having the keyword in the heading tags.

Every page should have an H1 tag, as search engines look to the H1 to help determine the topic of a page. It should be the first thing in the body text of the page and should appear prominently.

H1 tags should never contain images or logos, only text. The keyword of a page needs to be used in the H1 tag, and in at least half of the total heading tags on a page, if more than one heading tag is present.

From a usability perspective, paragraphs should never be longer than 5 lines of text, and it is wise to break up a page every 2-3 paragraphs with a sub-heading in the form of an H tag (H2 or H3) or an image. Testing has shown that when users are faced with a large block of unbroken text, most either skim over the text or skip it altogether, so content needs to be divided into usable chunks.

It is important that the keyword of a page be used in the H1 tag, as close to the beginning of the H1 as possible. Ideally, there should be at least one additional H tag on each page that contains the keyword, for added SEO value. Heading tags are a nested element and should be used in the correct order.

No H tag should be used if the preceding numerical tag has not been used (don't use an H2 if there is no H1, don't use an H5 if there is no H4, etc.).

Content

Score 5/10

Analysis

Currently on the Website, the content situation is as follows:

Keyword Usage in Content: The website lacks proper keyword research and keyword placement. Consider using keyword and variations and one or two main keywords per page.

Content Amount/Quality: Add more unique & quality content in the product and blog section, create proper service pages to make the site appear in both google search, google overviews and AI search engines,

Content Growth: New content isn't added very regularly. Content isn't periodically updated & the main focus isn't on adding fresh content frequently. There is no content added in the blog section since 2024. Add at least 1 weekly post and link it to the home and service pages. This will keep the website content fresh and will also increase visibility in top positions.

Media to Text Images doesn't contain alt text and hence doesn't know well about them. Add specific ALT tags and rename the images so google knows what you have in the images.

Recommendations

You should consider building out more top-level pages and adding more content. Conduct proper keywords research and use one- or two-min keywords and keyword variations per page.

Guidelines

One of the most important on-site SEO elements is text content, and search engines want to see a significant amount of unique text on each page. Under ideal circumstances I would recommend having 400-600 words of unique text per page, though I believe the safe minimum is 300 words.

For usability reasons, no page should ever be longer than 800 words (with the exception of blog posts). This content needs to contain the relevant keywords for the page. Having unique, keyword rich text on a page can help to improve search engine rankings significantly.

Duplicate content is considered as a big negative. It can not only hurt rankings but can prevent a page from ranking. Search engines want to see unique content on a site and can penalize a site for using duplicate content. Using flash or images in place of text is considered a big negative. While search engines like a variety of media, it must not take the place of text.

Internal Linking & Anchor Text

Score 5/10

Analysis

Only 1 internal link is present inside each blog post and they are also generic, not keyword optimized. The rest of the site pages don't have any internal links. The external links are inserted, and they point to Facebook and google search, and many of these links are not opening.

Recommendations

I recommend that absolute URLs be used internally, not relative URLs. I also recommend that the total number of links on each page be reduced as needed to keep the total less than 100 links per page to stay in-line with SEO best practices. This might require re-coding the comment system to prevent commenter names from being links.

Also, minimize instances of external linking from within the site. If site-wide links must be used, I recommend implementing NoFollow tags on all such links.

Establishing a good bedtime routine is essential for children, and one of the most effective tools in achieving this is reading [story books](#). These books not only entertain but also play a crucial role in helping children relax and drift into a peaceful sleep.

The Psychological Impact of Story Books on Sleep

Children's minds are constantly active, processing new experiences and information. This can sometimes lead to difficulties in winding down at the end of the day. These stories act as a gentle bridge between the active daytime and the restful nighttime. Here's how:

1. Providing a Sense of Security

Familiar stories and characters offer children a sense of comfort and security. This feeling of safety is essential for a good night's sleep. When children listen to or read about characters they love, they feel reassured, which helps them relax and prepare for sleep.

2. Reducing Anxiety and Fear

Many children experience anxiety and fear before bedtime, often triggered by the dark or the unknown. Fairy Tales with positive and calming narratives can alleviate these fears. By focusing on the story, children can divert their attention from any anxieties, making it easier for them to fall asleep.

The Routine of Bedtime Reading

Guidelines

It is very important to cross link within the pages of one's site using keyword rich anchor text, though you should do so sparingly. Pages of similar topic should cross link to each other using their keywords of those pages in the anchor text. I recommend 2-3 keyword rich internal links on any given page.

In addition to linking from within the text of a page, keyword relevant anchor text should be used in the main navigation elements. Where space prevents the use of a relevant keyword for the page being linked to in the navigation, it is important to include the title element in the anchor tag.

The same goes for links outside of the site. Approximately 15-30% of all inbound links from blogs, forums, press releases, or any other external link building should include the keyword of the page being linked to in the anchor text of the link (or a close variation).

Image Names & ALT Tags

Score 3/10

Analysis

6024 images on the site are missing alt attributes, relatively few of the images found on the site had descriptive, keyword rich image names.

MISSING ALT TEXT

https://gufhtugu.com/wp-content/uploads/2022/03/Data_Analysis-3-247x395.jpg<https://gufhtugu.com/wp-content/uploads/2020/04/NIB-0267-2-247x395.jpg><https://gufhtugu.com/wp-content/uploads/2023/07/1-247x395.png>

Recommendations

I recommend that ALT tags be written for each image (including design elements like borders, buttons, etc.) that currently doesn't have ALT tags. Keywords should be used in ALT tags.

Guidelines

For the benefit of search engines, code compliance, and visually impaired users, every image MUST have an ALT tag. The ALT tag should contain a keyword relevant to the page/en-us (but only if the keyword is relevant to the image as I II).

Image file names should be descriptive words, not numbers or query strings. They should accurately describe the image, and if relevant should also use the keyword. If an image is used as a link, then the ALT tag functions in place of anchor text.

By ensuring that all images are properly named and tagged, you will not only increase the SEO value of those images, but you will increase the likelihood of receiving referral traffic from image search results. Also, for code compliance reasons, all images should also specify a height and width in the image tag.

NoFollow Anchor Tags

Score 4/10

Analysis

NoFollow tags are needed for the external links on the site, right now there are some links that require it. This smaller number of links isn't going to hurt the site much, but rules are to be followed.

Recommendations

You should consider adding NoFollow tags to site-wide links that point to the external websites.

Guidelines

Google measures how different pages link together and assigns a weight to those links based on traffic, relevancy, age, size, content, and hundreds of other components.

When pages that Google deems relevant link to other pages, some of that "Link Juice" flows through that link to the site being linked to. A "followed" link is essentially endorsing the page being linked to.

Enter the rel="nofollow" tag. Google introduced this tag to help preserve the relevancy of PageRank, which was being hurt by blog and forum comment spammers. When the tag rel="nofollow" is used in an anchor tag (link), Google will usually pass 50-100% less "link juice" to the page being linked to. Using this tag is like saying "this page is nice, but I don't really endorse it."

NoFollow tags should be used on blog comments, site-wide external links, and on any internal links pointing to low quality or otherwise user-worthless pages.

4. INDEXING OVERVIEW

SCORE
60%

This analysis addresses all of the SEO Indexing related issues found on the Website. Implementing the recommended changes should provide valuable SEO benefits.

Major Issues (1-3)

Moderate Issues (4-7)

Minor Issues If Any (8-10)

For each main SEO indexing topic, there are 3 sub sections: Analysis, Recommendations and Guidelines. The Website has an Indexing SEO Score of 60%. This indicates good index-ability. Correct implementation of the proceeding guidelines will help to improve its existing rankings, and to rank for more competitive keyword phrases in the future.

Indexing Optimization Analysis

Score 4/10

Often, I find large variances in the pages that each search engine decides to keep in their index for their users. This is usually a symptom of one large or several small indexing problems.

L: 0 LD: 1.34K I: 7.29K whois source Rank: 5.65M

"اکیس جلیل القدر تابعین کرام" حضرت مولانا محمد عبد الرحمن کی کتاب، Gufhtugu.com پر صرف 600/- روپے میں دستیاب ہے۔ آج ہی خریدیں!

Websites with smaller variances of pages indexed in the search engines have very few if any indexing problems.

For the site Google has 303 URLs indexed, while Bing has 21. However, our crawl found 2939 static, index-able, non-parameterized URLs reachable by a link-to-link crawl.

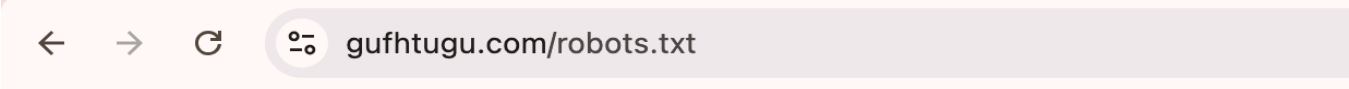

This level of variance means that there are indexing issues present that are causing the search engines to maintain an incorrect index. The proceeding recommendations will reduce the confusion of pages available to the search engines and help in the maintenance of the Website. Every page indexed enables the domain to rank for search terms contained on those pages, which means an additional point of entry. This is why it is important to keep track of how many pages there are and how many are indexed.

Page Exclusions

Score 10/10

Analysis

A robots.txt file was found and is partially optimized. It correctly blocks /wp-admin/, WooCommerce system folders, and add-to-cart parameter URLs which is good for crawl budget on a large catalog. It's missing a Sitemap directive and doesn't block other low-value URLs (?s=, ?orderby=, cart/checkout/account pages).

A screenshot of a web browser's address bar. It shows navigation icons (back, forward, refresh) on the left, followed by a search icon and the URL "gufhtugu.com/robots.txt".

```
User-agent: *
Disallow: /wp-content/uploads/wc-logs/
Disallow: /wp-content/uploads/woocommerce_transient_files/
Disallow: /wp-content/uploads/woocommerce_uploads/
Disallow: /*?add-to-cart=
Disallow: /*?*add-to-cart=
Disallow: /wp-admin/
Allow: /wp-admin/admin-ajax.php
```

Recommendations

1. Exclude the unnecessary pages by adding them in robots.txt and marking them disallowed.

Guidelines

Effectively covering the function of the robots.txt file here isn't possible. To learn more about robots.txt best practices, simply visit this page: <http://www.robotstxt.org/robotstxt.html>

If you ever have a page that you don't want Google to index, but that has links you do want Google to crawl, at that time you would need to implement a page level tag. Page level Meta robots NoIndex tags would be particularly useful on any page of your site that you would not want a searcher to enter on, such as a thank you pages, privacy policy pages or T&C pages.

Page Inclusions

Score 10/10

Analysis

Page inclusions consist primarily of creating an XML sitemap and submitting it through your Google and Bing webmaster Tools accounts.

XML Sitemap

Generated by **Yoast SEO**, this is an XML Sitemap, meant for consumption by search engines.

You can find more information about XML sitemaps on sitemaps.org.

This XML Sitemap Index file contains 21 sitemaps.

Recommendations

Link the sitemap in robots.txt.

Guidelines

An XML sitemap should be created for every website and should be updated and re-submitted whenever changes are made to the site.

URL Redirects

Score 7/10

Analysis

86 standard non-WWW to WWW redirects are in place. 64 pages are with 301 redirect, and 22 pages are with 302 redirect.

Recommendations

302 redirects are temporary and don't pass full link equity like 301s. Convert all 22 pages currently on 302 to permanent 301 redirects, since these are standard non-WWW → WWW redirects.

Guidelines

Unless a redirect is truly temporary (such as for a time sensitive promotion), 302 redirects should never be used. 302 redirects don't pass any link value, and are essentially a dead end for SEO. In almost every scenario where a redirect is needed, a 301 redirect should be used.

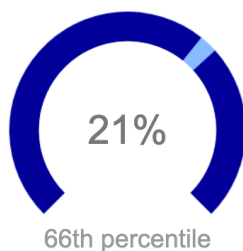

Any page that changes URLs or is deleted needs a 301 permanent redirect to tell search engines and users that the page has moved/is gone. There should never be more than one URL path to a page.

Duplicate Content

Score 4/10

Analysis

I did not find any coding issues present that could create potential duplicate content problems that were not already addressed correctly.

Duplicate Content

The duplicate content for your site is 21%. The median for all other sites is 16%. The duplicate content for your site is more than 66% of all other sites.

Recommendations

Try to keep your duplicate content minimum.

Guidelines

Search engines really don't like duplicate content, as it leads to a poor user experience and other content quality issues. If you have duplicate content, you need to do everything you can to eliminate it.

There are 4 main options for addressing duplicate content:

- Fix the URL structure of the site to eliminate accidental duplicate content coming from URL issues, per the recommendations in the URL Redirects section and this section.
- Re-write all duplicate text content to make it unique.
- 301 redirect the duplicate content to one canonical page/site, if it is in your control.
- Implement the rel="canonical" tag to identify the original source/root page to search engines.

Google makes a pretty serious effort to find duplicate content and keep it out of its index, so this is not something to take lightly.

Broken Links

Score 9/10

Analysis

Google webmaster Tools for the site identified 20 error pages with 404 response code.

404 PAGES

<https://gufhtugu.com/zeeshanusmanibook/>

<https://gufhtugu.com/thomas-the-tank-engine-the-very-first-stories-thomas-friends/>

<https://gufhtugu.com/first-100-words-bright-baby/>

<https://gufhtugu.com/little-star-dora-the-explorer/>

Recommendations

Implement a 301 redirect for any 404 page, pointing to the most appropriate live URL. In the future, whenever any changes are made to the URL of a page that has previously been live, you will need to implement a 301-redirect pointing the old URL to the new URL. You will also need to change all internal links on the site that point to the old URL to point to the correct new URL.

Also, regularly monitor Google and Bing webmaster Tools for crawl errors (broken pages and other site errors) and assign someone to create 301 redirects for any broken pages that are found.

Guidelines

Because Google and other search engines crawl the I b link-to-link, broken links can cause SEO problems for a website. When Google is crawling a site and hits a broken link, the crawler immediately leaves the site. If Google encounters too many broken links on a site it may deem that site a poor user experience, which can cause a reduced crawl rate/depth, and both indexing and ranking problems.

Unfortunately, broken links can also happen due to someone outside of your site linking in incorrectly. While these types of broken links can't be avoided, they can be easily fixed with a 301 redirect.

To avoid both user and search engine problems, you should routinely check Google and Bing I bmaster Tools for crawl errors, and run a tool like XENU Link Sleuth or Screaming Frog on your site to make sure there are no crawlable broken links.

If broken links are found, you need to implement a 301 redirect per the guidelines in the URL Redirect section. You can also use your Google I bmaster Tools account to check for broken links that Google has found on your site.

Code Validation

Score 9/10

Analysis

I ran the home page through the W3C Validation Tool, and this was what I found:

Press the Message Filtering button to collapse the filtering options and error/warning/info counts.

Errors (51) · [Hide all errors](#) · [Show all errors](#) · [Show only HTML errors \(48\)](#)

- ☒ Bad value `1` for attribute `crossorigin` on element `Link`.
- ☒ CSS: `font-weight: 0` is not valid, only values greater than or equal to `1.0` are allowed. (3)
- Element `<div>` not allowed as child of element `<div>` in this context. (Suppressing further errors from this subtree.) (23) · [Hide all](#) · [Show all](#)

Errors are common, and 51 errors and 107 warnings mean your site could potentially have trouble on browsers, and can potentially pose a problem to search engine spiders.

Recommendations

While it isn't strictly necessary, you would ideally want to make whatever code changes you need to make to ensure sure all pages on the site validate at 100% via the following validator to err on the side of caution.

In addition to validation via W3.org, you will want to test the site on all major browser types to make sure that there are no cross-browser compatibility issues.

Guidelines

The W3C markup validator service can be found at this location <http://validator.w3.org/>.

Because there are so many programming languages and so many ways to accomplish any one thing using each language search engines rely on certain rules in which they read the content of the Website.

Having code that adheres to these rules removes and helps to minimize errors when parsing or separating the code from the content of any one page.

Search engines such as Google have openly stated that W3C standards are what they suggest when making the code easy to understand for them. I typically only test the home page of the Website, because many issues can be easily fixed a crossed the entire website using just its page templates.

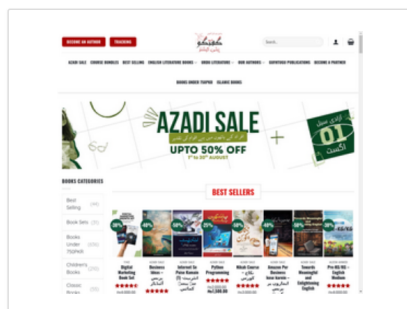

Page Load Speed

Score 4/10

Analysis

When I scanned your site using Pingdom Tools, I found the following:

Your Results:

[DOWNLOAD HAR](#)[SHARE RESULT](#)

Performance grade

D 65

Page size

26.4 MB

Load time

3.42 s

Requests

370

While a page load speed of 3.42 seconds is considered slow, I feel that the load speed shown on this scan was incorrect. Based on the number of requests and the page size, I believe the load speed is likely in the 4 seconds range. Webmaster Tools or Google Analytics can provide a more accurate page load speed. If the page load speed really is in the 3 seconds range as I believe it is, that is below average, and is slow enough that it is almost certainly impacting your conversions, especially on mobile devices.

370 requests is a significant number, and the number of items loading is a key factor in load speed. I recommend that no page call in more than 40 times, preferably if possible. In addition, a page size of 26.4 MB is large and it should be reduced significantly. I recommend that page size be kept to 500kb or less to avoid load speed issues. I saw no use of compression or minification to minimize file sizes.

Recommendations

There are a few things you can do to increase that page load speed to reach Google's recommended page load speed of 1.4 seconds or less. I would recommend leveraging browser caching, CSS Sprites for images where possible, and reducing the image file sizes as much as possible for images that can't be spirited (different file types, removing unnecessary color channels, etc.).

I would also recommend reducing the total number of CSS and JavaScript files by combining them into fewer files, and minimizing the file sizes by using compression and minification where feasible.

You might also see benefits by using a content delivery network (CDN) for your images.

W3 Total Cache is an excellent Wordpress plug-in that can help with page load speed issues, and a simple CDN can be set-up via Amazon AWS for very little money.

Content size by content type

CONTENT TYPE	PERCENT	SIZE

challenges.cloudflare.com	0.81%	3
fonts.googleapis.com	0.54%	2
other	4.05%	15
Total	100.00%	370

Guidelines

On April 4th, 2010, page load speed officially became a part of the Google search ranking algorithm. For usability reasons, best practices dictate that a l b page should load within 1-2 seconds on a typical DSL connection. However, according to Google Webmaster Tools data a load time of 1.4 seconds is the threshold between a fast page and a slow page. That means, ideally, that every page on your website should load in 1.4 seconds or less, to receive the maximum SEO benefit for fast loading pages.

Google gathers page load time data through actual user experience data collected with the Google search toolbar and may also be combining that with data collected as Google crawls a Website. As such, page load speed in terms of the ranking algorithm is being measured using the total load time for a page, exactly as a user would experience it.

Schema & Structured Data

Score 2/10

Analysis

There is one unnamed schema which is of no use. Include valid schema markup (structured data) with Organization, LocalBusiness, Product, or FAQ schema. One FAQ page exists on the website but it also don't have FAQ schema.

1 valid item detected

Valid items are eligible for Google Search's rich results. [Learn more](#)

Details

Crawl

Crawled successfully on Aug 20, 2026, 3:17:14 PM

Detected items

Unnamed item

type	BreadcrumbList
id	https://gufhtugu.com/#breadcrumb
itemListElement	
type	ListItem
position	1
name	Home

Recommendations

Implement Organization and LocalBusiness schema sitewide, including sameAs links to verified social and business profiles. Add FAQPage schema to priority service and content pages.

Guidelines

Structured data does not directly change rankings, but it helps both classic search engines and newer AI systems (Google AI Overviews, ChatGPT, Perplexity) confirm what an entity is before citing it. Schema.org is the standard vocabulary; JSON-LD is the recommended format.

AI Optimization

Score 1/10

Analysis

The website doesn't contain answer ready content that are necessary to get cited on AI search engines and google voice searches. Exploit AI-answer opportunity for the website.

Check AI visibility

For example, Ahrefs

Powered by [Ahrefs Brand Radar](#)

14

Total Mentions ⁱ

 1

Gemini ⁱ

 3

Perplexity ⁱ

 1

AI Mode (new) ⁱ

 5

AI Overviews ⁱ

 4

AI Mode ⁱ

Recommendations

Track AI citation monthly for 15–20 priority queries, logging whether the site is cited and which competitor appears instead when it isn't. Ensure Organization/LocalBusiness schema and clear entity information are in place, since AI systems rely on structured, confirmable facts when choosing what to cite. Add FAQ sections with FAQPage schema to the homepage, blog, and service pages, and write answer-ready content throughout the site to improve visibility in AI and voice search.

Guidelines

Write questions buyers and users actually search on Google, ask on social media, and your team receives. Keep answers short and accurate, and only markup FAQPage schema when the Q&A is visible on the page. Treat citation tracking as directional monitoring rather than a precise ranking position. AI-generated answers vary by exact phrasing, user location, and session, so consistency of citation over time matters more than any single check.

5. LINKING ANALYSIS OVERVIEW

SCORE
42%

This analysis addresses the key linking related issues found. Implementing the recommended changes should provide valuable SEO benefits.

Red = Major Issues (1-3) | Yellow = Some Issues (4-7) | Green = Minor Issues If Any (8-10)

For each main SEO linking topic, there are 3 sub sections: Analysis, Recommendations and Guidelines.

The Website had an SEO Linking Score of 42%. This indicates a good SEO link-ability. Correct implementation of the proceeding guidelines will help to improve its existing rankings wherever necessary, and to rank for more competitive keyword phrases in the future.

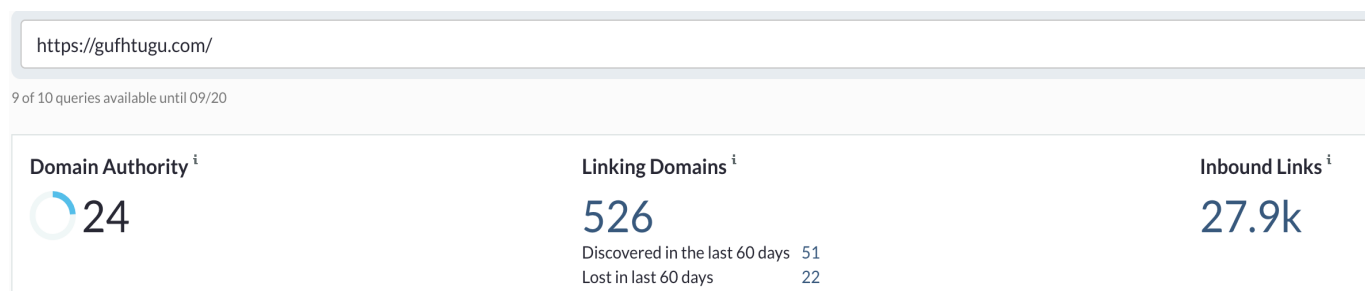

Linking Root Domains

Score 7/10

Analysis

When I scanned the Website using Moz Link Explorer (one of the best link indices available), and I found linking root domains pointing in.

Your number of linking root domains is 526, it is a bit low when compared to many of the top sites whose topics overlap with the Website.

Recommendations

I recommend working to significantly increase the number of linking root domains. There is still significant room for improvement.

There should be an emphasis on domain diversity (getting links from many different domains) and domain authority (a mix of high and medium quality sites). The creation of link worthy content, guest blog posts, and high profile press mentions should be a key focus.

Guidelines

The very best links come from trusted domains (sites like the New York Times, Wall Street Journal, Wired, Inc., TechCrunch, Huffington Post, Wikipedia, etc.). The more links you can get from authoritative Websites, the better, and guest blog posts and press mentions are a great way to get those links.

One of the things that Google looks at and factors into the algorithm is domain diversity. Essentially, the concept is that 10 links from 10 domains would be more valuable as a ranking factor than 10 links from one domain.

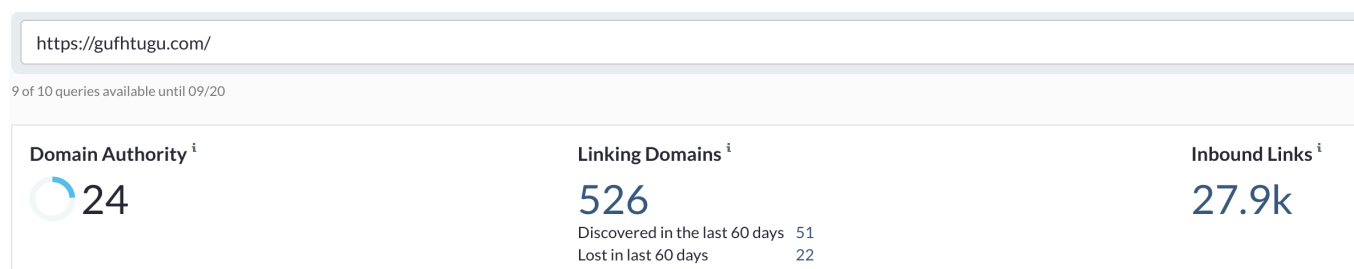

From an SEO perspective, you usually want to see a domain diversity of no less than 10% (i.e. 100 links from 10 domains), though higher is usually better. All other factors being equal, the site with the larger number of linking root domains would almost always rank higher. That said, in the case of extremely high quality sites an acceptable domain diversity could be as little as 2%.

Inbound Followed Links

Score 7/10

Analysis

When I analyzed the Website using Moz Link Explorer (one of the best link indices available), I found that it currently has 27.9K inbound established links pointing into the site. This is a significant number of links, and it has 526 root domains, it means that all these links are from 526 Websites and the site it is still behind many of the ranking competitors in your space.

Recommendations

One of the most important elements of Google's ranking algorithm is the quantity and quality of external inbound links. Roughly half the algorithm ties directly to traditional links. Google also looks at anchor text, surrounding text, page topic, and linking site topic as signals for which keywords a site should rank for.

Prioritize earning links from new, unique domains over more of the same ones, as domain diversity matters more than raw volume for competitive ranking. Keep keyword-focused anchor text to 15–30% of total links, since over-optimization can trigger ranking penalties. Emphasize a mix of high- and medium-authority domains, and focus on link-worthy content, guest posts, and high-profile press mentions to build this profile.

Guidelines

Google, and all search engines for that matter, look at links as a signal as to how legitimate a Website is. One of the key ranking factors is inbound links, and Google looks at those for the following:

- Quantity – The total number of links coming in.

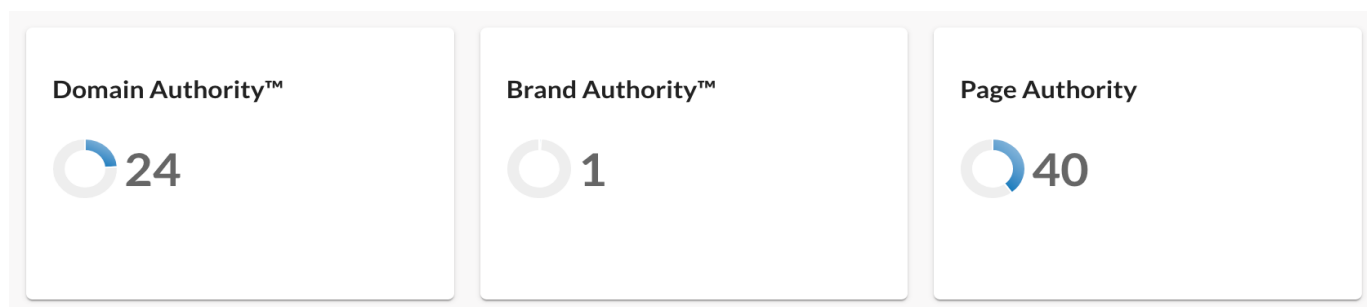

- Trust/Quality – Which sites links are coming from, and where on those sites the links appear.
- Authority – The online authority of the linking Website.
- Topical Relevancy – How relevant the Website and the page linking to you are to your Website.
- Anchor Text – The text of the link pointing to you. They also look at the text immediately surrounding a link for topical clues.
- Domain diversity – how many domains are linking to the cite? It is crucial, 10 links from 10 domains outweigh 10 links from one domain. Aim for at least 10% domain diversity because sites with more and diverse linking root domains generally rank higher.

Authority & Trust

Score 6/10

Analysis

Currently, the best metrics available to measure Authority and Trust are from SEOmoz, and are known as Domain Authority, mozRank and mozTrust. When I scanned the Website, I found:

The Domain Authority is on a 100 point scale, with any site above 40 being considered a fairly good quality site, and sites above 70 being considered truly high quality. mozRank and mozTrust are very similar to Google's PageRank, and serve to measure the distance of your site from trusted and authoritative Websites.

These metrics place the Website Wellabove average in terms of trust and authority, and Wellon your way to becoming a highly trusted site. However, you're still lagging a bit behind other, similar sites.

Recommendations

By further increasing the number of high-quality inbound links, and especially the number of high-quality linking root domains, the trust and authority will continue to increase. By focusing link building efforts on ever higher quality Websites these metrics will increase faster than they would with links from average sites.

Guidelines

Pages earn mozRank based on the number and quality of other pages linking to them. The higher the quality of the incoming links, the higher the mozRank. mozTrust is determined by calculating link "distance" betl en a given page and a seeded trust source on the Internet, such as .edu and .gov pages.

Social Media Visibility

Score
7/10

Analysis

Here is what our analysis found:

Platform	URL	Followers	Last Post
Facebook	https://www.facebook.com/Gufhtugu	219K	21 Aug 2026
YouTube	https://www.youtube.com/c/GufhtuguPublications	17.3K	31 Jul 2024
Instagram	https://www.instagram.com/gufhtugu/	15.9K	31 Jul 2026
LinkedIn	https://www.linkedin.com/company/gufhtugu-publications/	686	June 2026
Pinterest	https://www.pinterest.com/gufhtugup/	96	3 years ago

Recommendations

You aren't much active on all social fronts, reconsider your approach please.

Guidelines

I looked the site for the social media links but behind each social media icon has placed the link to share guftugu publication on user social media. Link these socials from your own website. When someone links to a Website from their Website, Google sees that as an endorsement, and that endorsement increases a website's ability to rank I ll. Social signals have a similar effect.

When someone tl ets or shares a link to your website, that is seen as an endorsement much link a link. The "trust and authority" of the person who sent that link is treated just like trust and authority for a Website and is based on the authority of the social user. To make the most out of social, the key is to:

- Make it easy for people to share your content socially, by integrating sharing features throughout your website, blog posts, etc.
- And to create content that is worthy of sharing and then reaching out to people in that space via social channels to ask for feedback about said content.

Competitive Link Comparison

Score 2/10

Analysis

Relative to stronger competitors in the online bookstore and publishing space, the current link profile lags.

Recommendations

I recommend working to significantly increase the number of linking root domains. There is still significant room for improvement.

Google Business Profile

Score 0/10

Analysis

The Google Business Profile is not made so it can't be audited for category accuracy, completeness of hours, photos, and attributes, or review volume and response rate.

Recommendations

Create Google Business Profile and add the correct the primary and secondary categories, complete all photos, hours, and attributes, and establish a process for responding to new reviews promptly.

Guidelines

An accurate, complete, actively maintained Google Business Profile is one of the highest-leverage levers for local search visibility, often outweighing on-page factors for map-pack rankings. It should contain consistent NAP, correct categories, regular posts/photos, and prompt review responses.

NAP Consistency

Score 0/10

Analysis

<https://gufhtugu.com/> doesn't mention address and phone number and also doesn't have a GMB. There are no local citations which are pivotal for a business to rank, they give the highest trust signals.

Recommendations

Add NAP (Name Address Phone Number) on the website and then audit existing citations (if already exist) across major directories, check for duplicates and dead listings, and correct conflicting NAP data before building any new citations.

Guidelines

Search engines cross-reference NAP data across the web as a trust signal for local rankings; inconsistent NAP data undermines that trust even when the website itself is well optimized. The site was not observed being well cited in Google AI Overviews, ChatGPT, or Perplexity for any of its core topics during this audit.

6. CONCLUSION

Overall, I found that the SEO situation on <https://gufhtugu.com/> is below average. There is still huge room for improvement. By working to fix the issues identified in this audit, you'll be able to achieve higher rankings for more keywords, and for more competitive keywords as well.

I'm confident that you will get there, and I'm here to help!

If you have any questions about your audit, please feel free to contact me!
